Hi Wolfgang,

I have installed the laptop with all the necessary stuff to run Basda and DrGreenthumb. It is on your desk.

We have done some test with the Moto controlers and everything seems to work fine.

I put a symbolic link of the configuration file on the Desktop, so they can change the ip address and put their own configuration.
There is also a small readme file, explaining how to use DrGreenthumb. to control the motors.

Also, running in the console the command "initArgos" , will initialize basda and DrGreenthumb automatically.

The user is argos, and password is argos2009 (same for root, as they may want to change the ip address and so on).

I have spoken with Frank and he will help you if needed when I'm on vacations.

See you in September.
Send me an email if you need something else.

Ciao
Jose
