The LBC Windows IBM (and associated cables) is located at the bottom shelf of one of the LBC handling carts and the spare power supply (and associated cables) is on the lower shelf of the other.

These were set up on the LBC work station in the lab as shown:
Hooking up the Windows IBM:

Connect the cables to the back of the IBM as shown above. Connect the 2 black power cables. Connect the fibers. The position of the black is marked. Connect the mouse, keyboard and the monitor.

Connect the power supply. 2 people will probably be needed for this. Two blue bars are used to support the power supply as most of the connectors are located on the base.

Connect the 2 blue rods to the front of the power supply in the location where the screws should already reside. Rest the back of the power supply on the shelf of the
desk and use the blue rods to support the front of the power supply. Connect the J3 power supply cable, and J1 Supply cable.
